TITLE: On the distinctive features of electron-optical systems for observation of magnetic microfields by the transmission technique [Report, Fifth All-Union Conference on Electron Microscopy held in Sumy 6-8 July 1965] III

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 5, 1966, 817-822

TOPIC TAGS: electron microscopy, electron microscope, magnetic domain structure, magnetic field

ABSTRACT: The authors discuss the measures to be taken to record with good resolution the domain structure of thin ferromagnetic films by the electron transmission (shadow) technique with the aid of one of the following Soviet electron microscopes: EM-3, EM-5, EM-7, UEM-100, and UEMV-100. To record domain structure one must either employ off-center apertures or baffles, or work with the microscope out of focus; only defocused operation is discussed in the present paper. Increasing the defocusing increases the sensitivity for recording weak magnetic fields but reduces the resolution. To obtain good resolution with the shadow technique it is important to make the diameter of the electron beam at the object as small as possible. This can be accomplished by reduc-

Card 1/2

ACQ NR: AP6015774

ing the diameter of the aperture and/or by increasing the power of the condenser lens. Different measures are indicated in employing different microscopes. It is desirable to protect the object from the magnetic field of the objective lens; this can be accomplished by increasing the distance of the object from the lens and simultaneously reducing the power of the lens. How this is best accomplished in the different microscopes is discussed briefly. The paper closes with a few remarks on stroboscopic operation and preparation of thin films. A number of electron micrographs of magnetized Permalloy films recorded under different conditions are presented. The authors thank G.V.Sivak for a valuable discussion. Orig. art. has: 6 figures.

TITLE: Concerning thin films prepared by cathod sputtering of ferrites /Report,
Second All-Union Symposium on the Physics of Thin Ferromagnetic Films held in
Irkutsk, 10-15 July 1964/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 4, 1965, 626-628

TOPIC TAGS: ferromagnetic thin film, ferrite, cathode sputtering

ABSTRACT: In view of the fact that cathode sputtering has been reported (G. V. Spivak, I.G.Sirotenko, and R.D.Ivanov, Izv. AN SSSR, Ser. fiz. 25, 581, 1961) to conserve the exact chemical composition of the initial material, this technique was employed to prepare films of the monoferrites $\text{NiO}\cdot\text{Fe}_2\text{O}_3$, $\text{CuO}\cdot\text{Fe}_2\text{O}_3$ and $\text{CoO}\cdot\text{Fe}_2\text{O}_3$. The resultant films were investigated to determine their structural and magnetic properties, which properties were then compared with those of the parent materials. Debye X-ray patterns were recorded to determine the crystal structure of the starting ferrites. The films were deposited on polished glass and on cleaved NaCl. Films of optimum thickness (300 Å) were examined in a transmis-

Card 1/2

L 50964-65

ACCESSION NR: AP5011445

2

sion electron microscope; in addition, electron diffraction patterns were recorded. Some of the diffraction patterns and micrographs are reproduced. The sputtering was realized in a setup with a thermal cathode providing an intense (about 3 A) discharge in xenon at a pressure of 5×10^{-3} torr. The specimen was connected at the third electrode. In view of their high resistance the ferrite specimens were coated on one side with silver to provide good electrical contact. Some thermal effects were noted, so that in general the film specimens were not identical in structure and parameters with the parent materials. The magnetic properties of the ferrite films were investigated in more detail by Galepov, who presented a report on the subject at the Irkutsk Symposium. Orig. art. has: 3 figures.

TITLE: Electron microscopic observation of domain structure dynamics in magnetic
films /Report, Fifth All-Union Conference on Electron Microscopy held in Sumy 6-8
July 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 5, 1966, 793-798

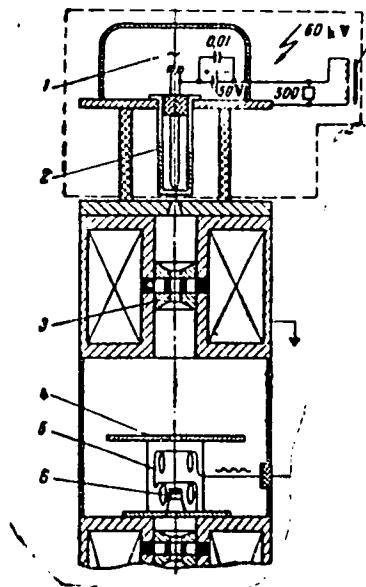

TOPIC TAGS: electron microscope, ferromagnetic film, magnetic domain structure,
stroboscope

ABSTRACT: Alterations in the domain structure of ferromagnetic films during rapid
magnetization switching have been observed with a stroboscopic electron microscope.
The present paper is devoted to a brief discussion of the technique. A cross section
diagram of the electron transmission microscope employed in the investigations is
shown in the figure. The magnetizing unit was similar to that of E.Fuchs and W.Liesk
(Optik, 19, 307 (1962)); it was supplied with alternating current, and the windings
were made to form part of a resonant circuit in order to increase the magnetizing
field. Only four of the windings were employed because full compensation of the motion

of the image was not required with stroboscopic operation. The microscope was operated ordinarily in the defocused condition. The electron beam was normally cut off by a 50 V potential applied to the gating electrode 2, and was turned on by a 60 V 0.5 microsec strobe pulse. The high cut off voltage was found to be necessary to prevent transmission during the off phase of the cycle of a low current of exceptionally high energy electrons, which led to considerable deterioration of the image. It was found that the stability of the domain structure from cycle to cycle that is requisite for stroboscopic observation obtains only at low switching fields, wherein the switching takes place by reversible domain wall displacement. The sharpness of the stroboscopic photographs depended strongly on the duty factor, the required exposure becoming excessive at low duty factors. By reducing the magnification, operating the microscope in

Card 2/3

L 3/1: C-66

ACC NR: AP6015769

The focused condition, increasing the accelerating potential to 60 kV, and increasing the pulse current to 1 mA, it was possible to record at a duty factor of 2.5×10^{-5} with an exposure only an order of magnitude longer than is required with normal operation under static conditions. Several photographs of the domain structures of Permalloy films are presented, which illustrate the resolution achieved and show the motions of the domain walls during a portion of the magnetization cycle. It is concluded that a stroboscopic electron transmission microscope can be employed to investigate the variations of the domain structure of thin ferromagnetic films during magnetization switching under conditions when the processes involved are reversible, and that the sharpness of the image depends on the stroboscopic duty factor and on the stability of the domain configurations from cycle to cycle. TITLE: Imaging of magnetic microfields in an electron mirror microscope /Report, Fifth All-Union Conference on Electron Microscopy held in Sumy 6-8 July 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 5, 1966, 813-816

TOPIC TAGS: electron microscopy, electron reflection, magnetic domain structure, electric field, magnetic field

ABSTRACT: The imaging of ferromagnetic domain structures by means of an electron mirror/microscope has been investigated with magnetic plumbite and cobalt single crystals and with an artificial sample consisting of a stack of 0.1 mm thick ferromagnetic sheets separated by equally thick copper sheets. When the ferromagnetic sheets in the artificial sample were magnetized in alternate directions to represent Bloch walls the electron images of the edges of the sheets were wedge-shaped with alternate wedges opening in opposite directions. This is ascribed to a shift of the image due to the action of the magnetic field at the surface of the specimen on the imaging electrons, the shift being a linear function of distance from the optic axis. Analogous spike-

Card 1/2

L 36561-66

ACC NR: AP6015773

like images were obtained of the domain walls on the (0001) face of the cobalt crystal. In this case, however, the boundaries of the spikes were not straight lines but very complex sinuous curves. This is ascribed to the influence of electric microfields at the surface of the specimen, and it is concluded that to record magnetic domain structure with the mirror microscope one must take measures to avoid the presence of such fields. The sensitivity of the electron mirror microscope to domain walls was found to be dependent on the orientation of the walls with respect to the optic axis, the sensitivity being greatest when the walls are oriented radially. The similarity of the electron micrographs to the actual domain structure as well as the anisotropy of the sensitivity is illustrated by comparison of electron micrographs of the surface of a magnetic plumbite crystal with photomicrographs of the corresponding powder patterns. PERIODICAL:

Priroda, 1958, Nr 8, pp 104-105 (USSR)

ABSTRACT:

The frequency of the sable and the squirrel in the various parts of Siberia is of interest since the squirrel is the principal food of the sable. Investigations were undertaken in the basins of the rivers Mama and Bol'shaya Chuya of the Irkutsk Oblast'. It has been found that sables abound in cedar forests. The frequency of the squirrel is the highest in the same areas. The stomach content of sables killed in cedar forests was investigated. It contained a high percentage of squirrels. It has been also found that the male sable daily covers 10.1 km on its hunting trips whereas the female sable makes only 5.9 km.

TITLE:

Thermal high frequency welding of plastic carburetor floats

PERIODICAL: Avtomobil'naya promyshlennost', no. 5, 1960, 41-43

TEXT: TsNITA has developed a device for the thermal high-frequency welding of carburetor floats made of polycaprolactam. Plain thermal welding was tried but failed to give a reliable hermetic seal. Gluing gave a good seal but required a prolonged drying time. The device (Fig. 3) consists of an LGD-1 (LGD-1) high-frequency generator and a semi-automatic welding machine. The use of 2 generator tubes gives a power of 1kw and a working frequency of 25 Mc. Power from the electric motor 4 is transmitted via a gear train and screw gear to the coaxially mounted cams 5 and 6. The spindle 1 derives its reciprocation from cam 6, while cam 5 serves to trim off the

outer beading and eject the welded float from the bottom punch 3. Welding is regulated by adjusting the gap between the top and bottom punches 2 and 3 (by adjusting the carriage 7) and by varying the feed-back inductance. The punch faces must be positioned in parallel, with a divergence of not more than 0.02-0.03 mm. The punches are also set to ensure the formation of a slight beading of the seam inside the float, since this makes for greater hermeticity. Welding time varies from 5 to 12 seconds, depending on the float size. The method is recommended for introduction in Soviet automobile plants. There are 3 diagrams.

TITLE: The Honing of Deep, Small-Diameter Hi-h-Precision Holes By Diamond-Filled Metalloceramic Hones

PERIODICAL: Avtomobil'naya promyshlennost', 1959, Nr 4, pp 36-38 (USSR)

ABSTRACT: The finishing of high-precision holes of 5-10 mm diameter and 5-10 mm length with a class 1 accuracy or higher is usually done manually on vertical finishing machines using special abrasive pastes. This process is time consuming, connected with a number of difficulties and its productivity is low. Honing is a more modern method of surface finishing, but because of the low mechanical strength of the hones, it was not possible to install honing machines on automatic lines. The author mentions that diamond-containing hones are described in foreign literature which provide a productivity increase of 20-30%. The discovery of large diamond fields in Yakutia caused an increase of the diamond utilization by Soviet industry and therefore, the application of diamond tools becomes important for mass production in the automo-

Card 1/3

The Honing of Deep, Small-Diameter High-Precision Holes By Diamond-filled
Metalloceramic Hones

bile industry. The author conducted an investigation concerning the application of diamond hones. He describes the preparation of the holes, the influence of the diamond concentration in the hone on the accuracy of the finish, the influences of diamond grit size, operating conditions, and various other factors affecting the productivity of the honing process. In his conclusions, the author states that the diamond concentration should not be below 1:6-200' than operating speed of 15-30 m/min. Metalloceramic hones with large diamond grains should be used for preliminary honing, while hones with fine grains should be used for the final processing. Compared to conventional hones, the wear resistance of diamond ones is 750 times higher. The specific productivity of diamond hones, concerning the consumption of pure diamonds, is 100 times higher than the specific productivity of corundum hones. There is 1 diagram, 4 photographs, 4 graphs, 4 tables and 3 references, 2 of which are Soviet, and 1 German.

Cudakov, N. G., and Pavlyuchuk, A. K. On summation functions of characters of numerical groups with a finite basis. Trudy Mat. Inst. Steklov., v. 38, pp. 366-381. Izdat. Akad. Nauk SSSR, Moscow, 1951. (Russian) 20 rubles.

Suppose \mathbb{G} is a multiplicative group of positive algebraic numbers with a finite basis $\omega_1, \omega_2, \dots, \omega_p$, where we assume $\omega_k > 1$ for $k = 1, 2, \dots, p$. Let \mathbb{G} be the semigroup generated by $\omega_1, \omega_2, \dots, \omega_p$. Suppose χ is a (not necessarily bounded) character of \mathbb{G} , that is a homomorphism of \mathbb{G} into the multiplicative group of non-zero complex numbers. Let H be the function defined on the non-negative real numbers by the formula $H(x) = \sum_{a \in \mathbb{G}, a \leq x} \chi(a)$. Suppose $\sigma_0 = \max_{1 \leq k \leq p} (\log |\chi(\omega_k)|)/(\log \omega_k)$ and q is the number of values of k for which $\sigma_0 = (\log |\chi(\omega_k)|)/(\log \omega_k)$. Then the authors prove the following assertions about the behavior of $H(x)$ as $x \rightarrow \infty$. (1) If $\sigma_0 < 0$, then $H(x)$ is bounded. (2) If $\sigma_0 = 0$, $q = 1$, and $\chi(\omega_k) \neq 1$ for all k , then $H(x)$ is bounded. (3) If $\sigma_0 = 0$ and $\chi(\omega_k) = 1$ for some k , then $H(x) = \Omega(x)$. (4) If $\sigma_0 = 0$ and $q \geq 2$, then $H(x) = \Omega((\log \log \log x)^{\frac{1}{2}})$. (5) If $\sigma_0 > 0$, then $H(x) = \Omega(x^{\sigma_0})$. Although (1) and (2) are almost trivial, the proofs of (3), (4), and (5) require delicate methods from analytic number theory due to Vinogradov, Gelfond, and Linnik. A particular case of the above is a result of Cudakov and Linnik [Doklady Akad. Nauk SSSR (N.S.) 74, 193-196 (1950); these Rev. 12, 393] to the effect that if \mathbb{G} is a multiplicative subgroup of the positive rationals generated by a finite set \mathfrak{P} of prime numbers and if χ is a bounded character of \mathbb{G} , then $H(x)$ is bounded if and only if \mathfrak{P} contains exactly one prime number and χ is not the principal character of \mathbb{G} .

ABSTRACT: The authors consider the principles involved in construction of units for setting up boundary conditions of the first kind when using the induced current method for simulation of Laplace field intensity. The boundary conditions are set by a summing amplifier. The problem of calculating the summing networks is considered in detail and a method is discussed for experimentally determining the boundary conditions without calculating the resistances in the ladder network. The use of a summing device with a differential input is proposed for setting up boundary distributions with potentials of different signs. 5 illustrations, bibliography of 1 title. From the summary. TOPIC TAGS: spectroscopy, electro simulation, spatial harmonics, high frequency
field, periodic system, induced current model, analog computer

ABSTRACT: The paper describes the most recent development of a new experimental
method for the analysis of the spatial harmonics of high-frequency fields of periodic
systems by means of induced current models. This method is based on the transfor-
mation of the spatial harmonics of a statistical field of periodic systems into the time
harmonics of an induced current, with the resulting analysis of the spectrum of the latter
by means of an ordinary, low-frequency spectroscope. The method permits automatic
recording and photographing of the spectra during a period of a few seconds, as well as
rapid analysis of the spectograms into the associated spectra of the spatial harmonics of

Card 1/2

L 23609-65

ACCESSION NR: AT5002500

a VHF field. Spectra are calculated for the spatial harmonics of the azimuth component of a high-frequency field of a cylindrical or linear system; these spectra are also experimentally derived and photographed using models of these fields and the calculated and experimental values are compared. The comparison confirmed the possibility of applying the indicated method to the automatic derivation and visual observation of spectra of the spatial harmonics of high-frequency fields of decelerated periodic systems with sufficient accuracy for most practical purposes. TITLE: On some peculiarities of the temperature dependence of the increase of the electrical resistivity of the deformed alloy Fe + 50% Ni at low temperatures

SOURCE: Ukrayins'kyy fizichnyy zhurnal, v. 9, no. 12, 1964, 1371-1373

TOPIC TAGS: resistivity of deformed alloy, martensitic phase formation, ferrous nickel alloy

ABSTRACT: In the iron-nickel alloy with the nickel content below 40%, martensitic transformation is observed on cooling to a sufficiently low temperature. At higher nickel concentrations, this transformation does not take place. However, it can be expected that deformation and cooling will produce in these alloys local formation of martensitic phase. As an indication of the new phase formation, the electrical resistivity was measured (see L. Kaufman and M. Cohen, Trans. Amer. Inst. Min (Metall.) Eng. 206, 1393 (1956)). Fe + 50% Ni alloy was pre-

Card 1/2

L 23937-65

ACCESSION NR: AP5001557

pared in the form of wires of 0.2 mm diem. and pressed between metal plates, and the resistance compared with that of annealed specimens. It was found that in specimens which were deformed and measured at -196 C, the increase of resistivity was noticeably greater than in specimens which were deformed at room temperature and measured at -196 C. This is attributed to local martensitic phase formation. The authors are grateful to Y. L. Mirkin for the Fe-Ni alloy. Orig. art. has: 1 figure

TITLE: Certain features connected with the K-state in Ni-Cr, Ni-Cr-Mo and Fe-Ni-Cr-Mo alloys

SOURCE: Fizika metallov i metallovedeniye, v. 20, no. 5, 1965, 733-740

TOPIC TAGS: metal physics, ordered alloy, mechanical property, resistivity, non-ferrous metal alloy, ferrous alloy, metal heat treatment, heat resistant alloy, high temperature strength, metal hardening

ABSTRACT: Changes in electrical resistivity in Ni + 15% Cr, Ni + 15% Cr + 18% Mo and Fe + 25% Ni + 16% Cr + 6% Mo alloys were studied as a function of low temperature deformation (from +20° to -196°C) and annealing rate (from 2 to 10^6 deg/min). Decomposition of the K-state in the alloys was observed. The effect of the K-state on high temperature strength was also noted. The K-state causes microscopic inhomogeneities.

Card 1/2

UDC: 539.4.015

L 14998-66

ACC NR: AP5028563

mogeneities which retard the motion of dislocations. In this work, the influence of the decomposition of the K-state was studied in terms of high temperature strength. The temperature dependence of electrical resistivity was obtained as a function of temperature and heating rate. For each alloy, the resistivity increased initially and at 500°C reached a peak, whereupon it dropped to a minimum (about 700° to 900°C depending on the alloy) and rose again. The drop in resistivity was associated with the decomposition of the K-state. Deformation by compression (60 to 70%) in the temperature interval from -196 to +20°C showed that the decomposition of the K-state was practically independent of deformation temperature. At higher temperatures (between 500° and 1000°C) and at high rates of heating, the decomposition of the K-state was studied by increasing the heating rate to 10^6 deg/min. The interval for the maximum decomposition was displaced to higher temperatures (300 to 450° higher), depending on the type of alloy. In the K-state region a significant strengthening was also noted when the speed of deformation was increased from 0.03%/min to 0.3%/min, while in the region of K-state decomposition no effect on strength was apparent. For fast heating rates, the rise in strength was maintained at higher temperatures than for slow heating rates. In particular, for Ni-Cr this region was expanded to 700°C, while for the other alloys to 900 or 1000°C. Where the K-state was decomposed at room temperature, no additional strengthening occurred upon pulse heating. Orig. art. has: 4 figures.

TITLE: Frequency band needed for frequency-type facsimile radio transmission

SOURCE: Elektrosvyaz', no. 11, 1966, 75-78

TOPIC TAGS: facsimile transmission, radio communication

ABSTRACT: According to the regulations of the Radiofrequency Commission, Ministry of Communications, SSSR, the required frequency band for F₄-radiation (facsimile transmission with FM of carrier by pulse photosignals) should be determined from this formula: $B_n = 2KN + 2D$, where N - maximum possible number of white and black elements of the transmitted picture per sec; D - transmitter frequency deviation; K - coefficient (1.5). For a typical case, the above formula would prescribe a bandwidth of 9.6 kc whereas in practice a band of 4-5 kc has been found sufficient. Factual frequency-band requirements of black-and-white and halftone picture transmission are examined, and these new formulas for B_n are deduced:

$$\left. \begin{array}{l} B_n = 2\Delta + 0.855N \text{ for } 0.14 < m < 0.77 \\ B_n = 2\Delta + 1.23N \text{ for } 0.77 < m < 1.7 \\ B_n = 2\Delta + 1.3N \text{ for } 1.7 < m < 2.5 \\ B_n = 2\Delta + 1.5N \text{ for } 2.5 < m < 3.45 \end{array} \right\}$$

TITLE: A temperature-stable magnetic-semiconductor balancing circuit for analog-to-digital converters (b6)

SOURCE: AN UkrSSR. Termostoykiye radiotelemetricheskiye sistemy (Heat resistant radiotelemetering systems). Kiev, Naukova dumka, 1966, 118-121

TOPIC TAGS: analog digital converter, transistorized circuit

ABSTRACT: A balancing circuit with high temperature stability used in analog-to-digital converters is described. The circuit, made with magnetic and silicon semiconductor components, includes a second harmonic magnetic modulator, an LC circuit and an amplifier tuned to the second harmonic, a phase detector with an amplifier, a transistorized key circuit, a square wave generator, and a magnetic frequency doubler. The converter works with an input frequency of 900 cps, and its zero drift does not exceed 10^{-15} v, a figure which corresponds to an input voltage of 0.4 μ v at an input impedance of 160 ohms. The converter starting voltage does not exceed 20 μ v, and its releasing voltage does not exceed 40 μ v. Its maximum operation time is 5 msec, and its operating temperature is -20—100C. The converter uses P104 or P106 transistors.

TITLE: Research into Electrolytic Thermo-elements (Issledovaniye elektroliticheskoy termopary)
PERIODICAL: Izmeritel'naya tekhnika, 1959, Nr 2, pp 35-37
(USSR)
ABSTRACT: The authors refer to an article by P.L. Lebedev in Teploenergetika (Thermal Energy), 1956, Nr 4, which states that an electrolytic thermo-element produces the same amount of voltage as a soldered thermo-element of the same metal. However, Lebedev does not state that the voltage is dependent on the thickness of the connecting solder coating. Tests were made with various metals such as copper, nickel and so on. When data on various metals is available, electrolytic thermo-elements may be prepared with any voltage from 0 to ε , where $\varepsilon = u_1 - u_2$ (u_1 and u_2 = potentials). The electrolytic thermo-element, however, has one drawback, namely, when the joints are damaged (through friction or oxydation),

Research into Electrolytic Thermo-Elements

SOV/115-59 -2-19/38

its voltage is reduced. Brittle metals, even if they have excellent thermo-element qualities, should not be used to produce soldered thermo-elements. However, these may be used to make covers for electrolytic thermo-elements. The authors suggest a method for using electrolytic thermo-elements to prepare thermo-piles, by mounting them on a plastic frame, the piles consisting of hundreds and even thousands of electrolytic thermo-elements. Such thermo-piles are, in fact, simply made and highly sensitive. There are 4 diagrams and 1 Soviet reference.

TITLE: On the stability of solutions of systems of second-order differential equations (linear and nonlinear)

PERIODICAL: Akademiya nauk UkrRSR. Dopovidi. no. 3, 1963, 315-318

TEXT: The linear system of differential equations

$$y'' + Q(t)y = P(t)y, \quad t \in [0, \infty) \quad (1)$$

is considered, as well as the nonlinear system

$$y'' + Q(t)y = F(t, y) \quad (2)$$

Here $y(t)$ is an n -dimensional vector, $Q(t)$ is a diagonal matrix,

Card 1/3

S/021/63/000/003/006/022

D405/D301

On the stability of ...

$P(t)$ is an arbitrary square matrix of n -th order, and $F(t, y)$ is a vector function. The stability of the trivial solution $y(t) = 0$ of system (1)-(2) is investigated. This system is reduced to an equivalent system of Volterra's integral equations and then the stability of its trivial solution is studied. It is assumed that

$$\int_0^{\infty} \|v(t)\|^2 \cdot \|P_1(t)\| dt = M_0 < \infty \quad (11)$$

and that

$$\|v(t)\| < k < \infty \text{ on } [0, \infty) \quad (13)$$

$V(t)$ is a diagonal matrix in Volterra's integral equation. Theorem 1: If conditions (11) and (13) hold, then the trivial solution $y(t) = 0$ of system (1) is stable. If, in addition, $\|v(t)\| \rightarrow 0$ for

S/021/63/000/003/006/022

D405/D301

On the stability of ...

$t \rightarrow \infty$, then the trivial solution is asymptotically stable. A similar stability criterion is derived for the nonlinear system (also in the form of a theorem). These two theorems permit estimating the rate at which the perturbations of the solutions of (1) and (2) tend to the trivial solution.

AUTHOR: Pavlyuk, I.A.

TITLE: On estimating the solutions of one class of non-linear differential equations of the second order

PERIODICAL: Akademiya nauk Ukrayins'koyi RSR. Dopovidi, no. 1, 1962, 5 - 8

TEXT: The author considers the equation

$$y'' + q(t)y = f(t, y, y') \quad (1)$$

where $q(t) > 0$ has second order derivatives in the interval $[t_1, t_2]$ and the function $f(t, y, y')$ is defined and continuous in D , where $D: t \geq 0; |y| < \infty; |y'| < \infty$. It is observed that Eq. (1) is an important equation in the theory of non-linear oscillations. It is supposed that

$$|f(t, y, y')| \leq p(t)/y^\alpha, \alpha > 0, \quad (2)$$

where $p(t)$ is some positive function on which conditions will be imposed later. To find an estimate of (1) the corresponding interval

Card 1/5

1241L

S/021/62/000/001/302/107

On estimating the solutions of one ... D251/D303

gral equation is considered, as discussed in the author's earlier article (Ref. 1: DAN URSR, 1323, 1960). By means of this integro-differential equation

$$y(t) = \psi [C_1 \sin \psi + C_2 \cos \psi + \int_0^t K_1(t, \tau) y(\tau) d\tau + \int_0^t K_2(t, \tau) f(\tau, y(\tau), y'(\tau)) d\tau], \quad (3)$$

where

$$\psi = q^{-\frac{1}{2}}(t); \quad \psi = \int_0^t q^{-\frac{1}{2}} dt; \quad K_1(t, \tau) = \eta(\tau) K_2(t, \tau);$$

$$K_2(t, \tau) = q(\tau) \sin(\psi(t) - \psi(\tau));$$

$$\eta(t) = \frac{q''}{4q} - \frac{5}{16} \left(\frac{q'}{q} \right)^2,$$

and C_1, C_2 are arbitrary constants, the inequality

$$z(t) \leq C + \int_0^t [k(\tau) z(\tau) + b(\tau) z^\alpha(\tau)] d\tau \quad (4)$$

and Perov's theorem [Abstractor's note: Theorem not stated], Card 2/5

12414

S/021/62/000/001/002/007

D251/D303

On estimating the solutions of one ...

following estimates for $y(t)$ are obtained: For $0 \leq \alpha < 1$, $|y(t)| \leq \varphi(t)R_1(t)$, where

$$R_1(t) = \left\{ C^{1-\alpha} \exp \left[(1-\alpha) \int_0^t k(\tau) d\tau \right] + (1-\alpha) \int_0^t b(\tau) \exp \left[(1-\alpha) \int_\tau^t k(x) dx \right] d\tau \right\}^{\frac{1}{1-\alpha}} \quad (6)$$

For $\alpha > 1$, $|y(t)| \leq \varphi(t)R_3(t)$ where

$$\begin{aligned} R_3(t) = C & \left\{ \exp \left[(1-\alpha) \int_0^t k(\tau) d\tau \right] + C^{\alpha-1} (\alpha-1) \int_0^t b(\tau) \exp \right. \\ & \times \left. \left[(1-\alpha) \int_\tau^t k(x) dx \right] d\tau \right\}^{\frac{1}{1-\alpha}}. \end{aligned} \quad (11)$$

[Abstractor's note: Certain symbols not defined]. Theorem 1: For equation (1) let either a) or b) hold where a) (2) and

$$\int_0^\infty k(t) dt < \infty, \quad \int_0^\infty b(t) dt < \infty \quad (12)$$

hold for $0 \leq \alpha < 1$, b) (2) and (12) hold and $C < R_2(\infty)$ where
Card 3/5

22414

S/021/62/000/001/002/067

On estimating the solutions of one ... D251/D303

$$R_2(h) = \left\{ \exp \left[(1-a) \int_0^h k(t) dt \right] \right\}^{\frac{1}{a-1}} \cdot \left[(a-1) \int_0^h b(t) dt \right]^{\frac{1}{1-a}}, \quad (8)$$

for $a > 1$. Then in case a) all solutions $y(t)$ of (1) are bounded provided $q^{-1}(t)$ is bounded as $t \rightarrow \infty$, or else tend to zero when $q(t) \rightarrow \infty$ as $t \rightarrow \infty$; In case b) all solutions $y(t)$ of (1), whose initial values $y(0)$ and $y'(0)$ lie in the region $C \subset R_2(\infty)$ are bounded provided $q^{-1}(t)$ is bounded as $t \rightarrow \infty$, or else tend to zero when $q(t) \rightarrow \infty$ as $t \rightarrow \infty$. It is shown that Theorem 1 may be extended to the system

$$y'' + Q(t)y = F(t, y, y') \quad (1')$$

where y is an n -dimensional vector, $Q(t)$ is a diagonal n -order matrix which has elements $q_i(t) > 0$, ($i = 1, 2, \dots, n$) and second derivatives in $[0, \infty)$. In this case the estimates are

$$\begin{cases} \|y(t)\| \leq \|v(t)\|/\bar{R}_1(t), \\ \|y(t)\| \leq \|v(t)\|/\bar{R}_3(t) \end{cases} \quad (1'')$$

Card 4/5

32414

On estimating the solutions of one ... S/021/62/000,001/002/001
D251/D303

where $\tilde{R}_i(t)$ ($i = 1, 2, 3$) are obtained by substituting $\bar{k}(t)$, $\bar{b}(t)$,
for $k(t)$, $b(t)$ in the formulae for R_i ($i = 1, 2, 3$), where

$$\bar{k}(t) = //V(t)//^2 \cdot //\bar{\eta}(t)//; \bar{b}(t) = p_1(t) //V(t)//^{\alpha+1} \quad (1)$$

and $\bar{\eta}$ is the diagonal n-order matrix, whose elements are given by

$$\eta_i(t) = \frac{q_i}{4q_i} - \frac{5}{16} \left(\frac{q_i}{q_i}\right)^2.$$

The method is illustrated by a worked-out example. There are 2 S.
viet-bloc references.
